Abstract

Innovation and entrepreneurship education, as well as employment guidance in higher vocational colleges, are of great significance for cultivating students' professional learning and practical abilities in these institutions. In the specific field of innovation and entrepreneurship education and employment guidance, it is essential to first clarify the objectives of each stage and understand the specific content points of the related tasks. Identify the entry point for integration and propose effective integration strategies. Through the analysis of this paper, we can understand that under the backdrop of integrating innovation, entrepreneurship, and employment guidance in higher vocational colleges, it is essential to foster students' entrepreneurial awareness. This can be achieved by optimizing course content tailored to the unique characteristics of each major, establishing school-based courses on innovation and entrepreneurship guidance, and enhancing integrated education practices. These measures aim to enhance the effectiveness of integrated education, guide the development of practical skills, foster innovative and entrepreneurial talents in higher vocational colleges, and nurture quality individuals.

Keywords
Higher vocational colleges, Innovation and entrepreneurship, occupational guidance

1. Introduction

Innovation and entrepreneurship education are of great significance for improving the quality of talent training in higher vocational colleges and solving the problem of insufficient richness and practicality in the traditional talent training model. Employment guidance is a process of providing targeted auxiliary support for students in higher vocational colleges after they choose employment or start their own businesses. The organic combination of the two can provide all-round support for students from theoretical study to practical exploration, which is an important condition for higher vocational colleges to ensure the quality of personnel training and highlight the value of innovation and entrepreneurship education in the new period. For teachers, adapting to the integration of innovation and entrepreneurship education and employment guidance is also an important aspect to reflect the innovation of their teaching ideas and the diversity of practical guidance methods.
2. Exploration of the value of the integration of innovation and entrepreneurship education and employment guidance in higher vocational colleges

2.1 Enhance students' professional qualities and exercise their comprehensive abilities

For the improvement of students' professional quality, both innovation and entrepreneurship education and practical employment guidance are conducive to improving students' professional ability. From theory to practice, we can optimize students' learning growth in all directions, achieve the goal of improving students' professional quality, and improving students' learning ability from various angles. Relatively speaking, the traditional career guidance process generally focuses on providing students with employment information and conveying the skills of job interview to students, but ignores the cultivation of students' independent innovation consciousness and entrepreneurial ability. Although independent innovation and entrepreneurship education can provide students with a certain practical platform with the help of school-enterprise cooperation, students' key ability in practice is practical operation ability, and their personal professionalism cannot be trained in practice. The organic combination of innovation and entrepreneurship education and employment guidance in higher vocational colleges can comprehensively improve students' professional quality and practical ability. Students can not only get more resources for learning theory and participating in practice under the background of integrated teaching but also fully realize the important role of personal professional ethics and professionalism in improving post-competence (Wang Xihui, 2024).

2.2 Optimize the allocation of educational resources and enhance the effectiveness of educational resource application

The effective utilization of educational resources not only reflects the educational guidance ability of teachers, but also serves as an important foundation for saving resources and playing a positive role in objective resource conditions. In the implementation of innovation and entrepreneurship education and employment practice guidance in vocational colleges, if the entry points and overall goals of innovation and entrepreneurship education can be clearly defined based on the needs of different students, and attention should be paid to guiding students from a practical perspective, it will be more conducive to playing the positive role of limited educational resources and improving resource utilization. Compared to repetitive or specialized construction of corresponding practice bases, practice bases in the context of integrated education can achieve better results by improving the functions of traditional practice bases. This can ensure that the construction of infrastructure and practical resources is more in line with the practical requirements in the context of integrated education (Wu Jing & Zhang Kunping, 2024). On the other hand, it is also an important means to maximize the saving of capital resources, optimize the allocation of resources, and improve the application effect of educational resources.

2.3 Promote the reform of the education system in vocational colleges and achieve educational innovation

The reform of the education system needs to be supported by a systematic and comprehensive planning scheme, and the organization and implementation of the reform of the education system in higher vocational colleges should also have clear goals, and use scientific and effective ways and means to lay the foundation for achieving good results in the end. Basic, for students in higher vocational colleges, the reform of education system is also an important way to reflect the educational guidance ability of teachers in higher vocational colleges. When the education reform can realize the organic combination of innovation and entrepreneurship education and employment guidance, it also means that the education reform has achieved phased results. Compared with the traditional independent education guidance mode, the organic combination of the two is a typical innovation, which can effectively promote the reform of the higher vocational education system, complete the two educational guidance tasks in a more flexible and innovative way, and achieve better talent training effect (Tan Liang, 2024).

3. The Feasibility of Integrating Innovation and Entrepreneurship Education with Employment Guidance in Vocational Colleges

3.1 Meet professional education goals and talent development needs

The integration of innovation and entrepreneurship education and employment guidance is of great practical value under
the educational background of higher vocational colleges, and it is also necessary and feasible to implement it. The educational goal of higher vocational colleges mainly focuses on cultivating high-quality talents with professional skills and innovative practice spirit. In the process of employment guidance, more attention is paid to guiding students to adapt to the needs of market talents of different majors in the process of improving their theoretical level and cultivating their practical ability, so as to get a smooth job. Realizing the organic combination of innovation and entrepreneurship education and employment guidance can help students position their employment choices more accurately based on market demand while consolidating their theoretical knowledge and mastering their professional skills, mastering more comprehensive innovation and entrepreneurship methods and technologies, and better finding a clear direction for personal career development and the satisfaction of personal employment needs. Under the current social background, innovation, and entrepreneurship education have also become an important driving force to improve the quality and fundamentally optimize the level of talent training. In the market environment, the demand for innovative and entrepreneurial talents is also increasing. The integration of the two aspects of education and guidance in higher vocational colleges is more conducive to cultivating professionals with innovative and entrepreneurial spirits and excellent practical ability (Liu Jiong, Zhao Shasha, & Jiang Feng, 2024), so as to meet the market demand and contribute to promoting social development and local economic development.

3.2 Meet the requirements of educational resource allocation and curriculum design

Under the background of innovation and entrepreneurship education and employment guidance in higher vocational colleges, the allocation of educational resources emphasizes flexibility and accuracy. The curriculum should be highly consistent with the allocation of resources, so as to better mobilize resources and give play to the role of different types of advanced resources in promoting curriculum teaching and personnel training. For example, in the application of teachers’ team resources, when innovation and entrepreneurship education are combined with employment guidance, relevant professional teachers can guide students from both theory and practice. From the teacher’s point of view, it can provide students with not only professional theoretical knowledge but also professional practice methods. In the process of employment guidance, more emphasis is placed on explaining and guiding some post-employment details and key issues affecting professional ability, which is consistent with the practical guidance content in innovation and entrepreneurship education. If the sharing of teachers’ team resources can be realized, it will help to apply the limited teachers’ team resources to conduct all-round guidance and education from students’ theoretical knowledge to practical ability and skills. The application and distribution of infrastructure and practice base resources, after the integration of education, innovation and entrepreneurship education, and employment guidance in higher vocational colleges, means that the specialized innovation and entrepreneurship education base resources can play a more concentrated role. Teachers only need to pay attention to the combination of different practical positions in the comprehensive education base to further refine the employment guidance for students. This can not only improve the efficiency of the practical dimension of innovation and entrepreneurship education, but also help students obtain more valuable theoretical learning resources and practical resources through more in-depth employment guidance, and improve their comprehensive quality.

4. Practical Strategies for Integrating Innovation and Entrepreneurship Education with Employment Guidance in Higher Vocational Colleges

4.1 Cultivate students’ entrepreneurial awareness

Students' subjective consciousness will have a very direct impact on the final educational effect. If students can subjectively produce the consciousness of self-employment and self-practice, it will have important practical significance for talent training in higher vocational colleges. Specifically, in order to stimulate students' entrepreneurial awareness and encourage students to actively participate in the theory of innovation and entrepreneurship education and the practice of employment guidance, higher vocational colleges need to take the following measures. First, we should build a perfect basic curriculum system. This paper combs and analyzes the relevant theoretical knowledge of innovation and entrepreneurship education and employment guidance, and realizes the construction of the curriculum system of mutual linkage between them. Promote students to realize the important significance of employment and entrepreneurship for personal development through theoretical study. At the same time, I also understand the importance of employment and entrepreneurship in personal life development. Second, higher vocational colleges need to rely on practical methods to stimulate students’ awareness of independent entrepreneurship from a practical point of view. From the goal, the ultimate goal of innovation and entrepreneurship education is to guide students to master theoretical knowledge and improve their practical ability. After having excellent basic support, make correct employment and entrepreneurship decisions. The
combination of innovation and entrepreneurship education and employment guidance can better cultivate students' entrepreneurial awareness and urge students to consider how to complete the entrepreneurial process on the basis of solid theoretical knowledge and certain practical experience. This is of great significance to innovation and entrepreneurship education and the final employment guidance practice. Third, higher vocational colleges should pay attention to building a good practice platform for students so that students have the opportunity to participate in practice independently and experience the specific working environment and practical ability needs of different positions and occupations. On this basis, it lays a foundation for stimulating students' entrepreneurial consciousness and cultivating students to choose employment or entrepreneurial paths with an objective and calm attitude. For the development of integrated education discussed in this paper, with the all-round guidance from theory to practice in the early stage, students' relatively mature entrepreneurial consciousness can be cultivated, which lays the foundation for students' subsequent independent choice and practice.

4.2 Optimize course content based on the characteristics of each major

Different types of majors in higher vocational colleges have objective differences in course teaching content and key content structure, so it is necessary to pay attention to the high matching between courses and majors when realizing the goal of integrating innovation and entrepreneurship education with employment guidance. The following key points should be grasped when optimizing the course content based on different majors. For example, in the teaching of information technology courses, based on the requirements of the integration of innovation and entrepreneurship and employment guidance, the theoretical teaching of professional courses should be integrated with the theoretical content of new technologies and new resources on the Internet platform. At the same time, theoretical knowledge related to big data analysis, artificial intelligence technology, and cloud computing platforms can be added. Help students fully and systematically understand the application principles and practical methods of new technologies and platforms. At the same time, we should also combine the requirements of innovation and entrepreneurship practice, lead students to use advanced technology to solve practical problems in the process of simulating projects, and try to carry out independent practice of software development or service platform function development. This is of great significance to improve students' professional ability and technical literacy. For art design courses, based on the background of the integration of innovation and entrepreneurship education and employment guidance, teachers are required to integrate innovative and divergent theoretical courses such as innovative thinking training courses, brand design courses, and user experience design courses into the theoretical courses to enhance students' design practice ability and sensitivity to the market environment. In further courses, teaching, project-based teaching, and school-enterprise cooperation are applied to lead students to participate in real design projects. Systematic analysis is made from the aspects of consumer demand and consumer psychological state, which points out the direction for personal design practice. Only by ensuring that the theoretical courses of different majors are optimized and improved can the theoretical courses be upgraded to meet the requirements of how to realize education and play the role of theory in guiding practice.

4.3 Offering school-based courses on innovation, entrepreneurship, and employment guidance

In the process of the integration of innovation and entrepreneurship education and employment guidance in higher vocational colleges, it is also of great significance to set up special school-based courses to optimize the effect of education guidance. Specifically, higher vocational colleges should do a good job in the following aspects and implement the development and teaching of school-based courses. First, higher vocational colleges should define specific objectives when offering school-based courses of integrated teaching. On the one hand, it teaches students the basic theoretical knowledge and practical skills of innovation and entrepreneurship. On the other hand, we should further guide students to understand the market dynamics and employment environment, and master vocational skills and career planning methods in their posts. Through the study of the course, we should be able to help students establish a correct concept of innovation and entrepreneurship, and enhance their professional quality and employment competitiveness. Second, in the setting of course content, we should integrate the requirements of a school-based curriculum based on innovation and entrepreneurship employment guidance, and introduce corresponding cases based on different majors. In terms of teaching methods, more practical situational teaching methods, role-playing methods, and simulated actual combat methods are used to implement the teaching process, providing sufficient independent practice experience space for different students. Third, the development of an integrated school-based curriculum should also match the construction of a teachers' team, so as to ensure that a team of teachers with excellent quality can meet the requirements of integrated education and training through the combination of external introduction and internal training, and lay the foundation for better talent training quality (Dang Jianmin, 2023).
4.4 Intensify the practice of integrated education

Practical education is also of great significance to the development of practical education guidance under the background of integrated education. For higher vocational colleges, innovation, and entrepreneurship education and employment guidance need to be organized and implemented based on practice. In the specific educational guidance work, more resources should be introduced to provide auxiliary support for the realization of education, improve the quality of practical education, and ensure the smooth development of practical education. In addition, some comprehensive social practice activities should also integrate optional activity resources under the background of educational guidance. Specifically, the types of practical activities can include business plan competitions, innovation and entrepreneurship training camps, career planning lectures, etc. Students can choose different practical activities based on their actual needs, and improve their comprehensive practical ability by participating in practical activities to meet the needs of cultivating innovative and entrepreneurial talents at this stage. With sufficient practical preparation, it will provide guarantee for adapting to the market environment and obtaining better entrepreneurial employment effects. In addition, strengthening practice also emphasizes that under the background of the integration of innovation and entrepreneurship education and employment guidance, we should pay attention to the targeted evaluation based on the effect of students’ independent participation in practice, and enhance the details of the evaluation, and strive to take the results of targeted evaluation as a guide to further stimulate students' subjective initiative to improve their personal practical ability and effectively improve their practical ability. For students, phased practice evaluation can also help them find their own shortcomings in practical ability in time, and provide support for better practical education guidance effect.

5. Conclusion

Through the analysis of this article, it is evident that innovation and entrepreneurship education, along with employment guidance in higher vocational colleges, are two crucial components that should be simultaneously prioritized. We need to take effective measures from multiple perspectives, such as resource support and the application of technical methods, to lay the foundation for improving the effectiveness of integrated education practices. In addition, attention should also be paid to the rational allocation of practical resources in integrated education. For teachers, the requirement of integrated education guidance also necessitates a shift in their educational guidance approach. They need to actively incorporate a variety of technologies and methods to effectively fulfill practical guidance tasks.
